Tag(s): Medium-Hard

Pussycat Sonya has a string **S** of length **N**. And she's asked **Q** queries of form: What is the minimal number of circular shifts in left direction of string **S** she needs to perform to get lexicographically smallest string, if she can do K_i such shifts at most?

Input:
The first line of input contains one integer **N** - the length of the string **S**.
The second line contains string **S**.
The third line contains one integer **Q** - the number of queries.
Each of the next **Q** lines contains one integer K_i.

Output:
Print the answers for all queries.

Constraints:

$1 \le N, Q \le 10^6$
$0 \le K_i < N$

SAMPLE INPUT

SAMPLE OUTPUT

Explanation

Let's take a look at all circular shifts in left direction of string **"pussycat"**:
0: **"pussycat"**
1: **"ussycatp"**
2: **"ssycatpu"**
3: **"sycatpus"**
4: **"ycatpuss"**

5: **"catpussy"**
6: **"atpussyc"**
7: **"tpussyca"**
We need exactly **i** operations to get **i**-th shift.

And now let's sort them lexicographically:
6: **"atpussyc"**
5: **"catpussy"**
0: **"pussycat"**
2: **"ssycatpu"**
3: **"sycatpus"**
7: **"tpussyca"**
1: **"ussycatp"**
4: **"ycatpuss"**
