Fast modular exponentiation

How can we calculate $A^B \bmod C$ quickly if B is a power of 2 ?

Using modular multiplication rules:

$$\text{i.e. } A^2 \bmod C = (A * A) \bmod C = ((A \bmod C) * (A \bmod C)) \bmod C$$

We can use this to calculate $7^{256} \bmod 13$ **quickly**

$$7^1 \bmod 13 = 7$$

$$7^2 \bmod 13 = (7^1 * 7^1) \bmod 13 = (7^1 \bmod 13 * 7^1 \bmod 13) \bmod 13$$

We can substitute our previous result for $7^1 \bmod 13$ into this equation.

$$7^2 \bmod 13 = (7 * 7) \bmod 13 = 49 \bmod 13 = 10$$

$$7^2 \bmod 13 = 10$$

$$7^4 \bmod 13 = (7^2 * 7^2) \bmod 13 = (7^2 \bmod 13 * 7^2 \bmod 13) \bmod 13$$

We can substitute our previous result for $7^2 \bmod 13$ into this equation.

$$7^4 \bmod 13 = (10 * 10) \bmod 13 = 100 \bmod 13 = 9$$

$$7^4 \bmod 13 = 9$$

$$7^8 \bmod 13 = (7^4 * 7^4) \bmod 13 = (7^4 \bmod 13 * 7^4 \bmod 13) \bmod 13$$

We can substitute our previous result for $7^4 \bmod 13$ into this equation.

$$7^8 \bmod 13 = (9 * 9) \bmod 13 = 81 \bmod 13 = 3$$

$$7^8 \bmod 13 = 3$$

We continue in this manner, substituting previous results into our equations.

...after 5 iterations we hit:

$$7^{256} \bmod 13 = (7^{128} * 7^{128}) \bmod 13 = (7^{128} \bmod 13 * 7^{128} \bmod 13) \bmod 13$$

$$7^{256} \bmod 13 = (3 * 3) \bmod 13 = 9 \bmod 13 = 9$$

$$7^{256} \bmod 13 = 9$$

This has given us a method to calculate $A^B \bmod C$ quickly provided that **B** is a power of 2.

However, we also need a method for fast modular exponentiation when **B** is not a power of 2.

How can we calculate $A^B \bmod C$ quickly for any B ?

$$\text{i.e. } 5^{117} \bmod 19$$

Step 1: Divide B into powers of 2 by writing it in binary

117 = **1110101** in binary

Start at the rightmost digit, let $k=0$ and for each digit:

- If the digit is 1, we need a part for 2^k , otherwise we do not
- Add 1 to k , and move left to the next digit

$$117 = (2^0 + 2^2 + 2^4 + 2^5 + 2^6)$$

$$117 = 1 + 4 + 16 + 32 + 64$$

$$5^{117} \text{ mod } 19 = 5^{(1 + 4 + 16 + 32 + 64)} \text{ mod } 19$$

$$5^{117} \text{ mod } 19 = (5^1 * 5^4 * 5^{16} * 5^{32} * 5^{64}) \text{ mod } 19$$

Step 2: Calculate mod C of the powers of two $\leq B$

$$5^1 \bmod 19 = 5$$

$$5^2 \bmod 19 = (5^1 * 5^1) \bmod 19 = (5^1 \bmod 19 * 5^1 \bmod 19) \bmod 19$$

$$5^2 \bmod 19 = (5 * 5) \bmod 19 = 25 \bmod 19$$

$$5^2 \bmod 19 = 6$$

$$5^4 \bmod 19 = (5^2 * 5^2) \bmod 19 = (5^2 \bmod 19 * 5^2 \bmod 19) \bmod 19$$

$$5^4 \bmod 19 = (6 * 6) \bmod 19 = 36 \bmod 19$$

$$5^4 \bmod 19 = 17$$

$$5^8 \bmod 19 = (5^4 * 5^4) \bmod 19 = (5^4 \bmod 19 * 5^4 \bmod 19) \bmod 19$$

$$5^8 \bmod 19 = (17 * 17) \bmod 19 = 289 \bmod 19$$

$$5^8 \bmod 19 = 4$$

$$5^{16} \bmod 19 = (5^8 * 5^8) \bmod 19 = (5^8 \bmod 19 * 5^8 \bmod 19) \bmod 19$$

$$5^{16} \bmod 19 = (4 * 4) \bmod 19 = 16 \bmod 19$$

$$5^{16} \bmod 19 = 16$$

$$5^{32} \bmod 19 = (5^{16} * 5^{16}) \bmod 19 = (5^{16} \bmod 19 * 5^{16} \bmod 19) \bmod 19$$

$$5^{32} \bmod 19 = (16 * 16) \bmod 19 = 256 \bmod 19$$

$$5^{32} \bmod 19 = 9$$

$$5^{64} \bmod 19 = (5^{32} * 5^{32}) \bmod 19 = (5^{32} \bmod 19 * 5^{32} \bmod 19) \bmod 19$$

$$5^{64} \bmod 19 = (9 * 9) \bmod 19 = 81 \bmod 19$$

$$5^{64} \bmod 19 = 5$$

Step 3: Use modular multiplication properties to combine the calculated mod C values

$$5^{117} \bmod 19 = (5^1 * 5^4 * 5^{16} * 5^{32} * 5^{64}) \bmod 19$$

$$5^{117} \bmod 19 = (5^1 \bmod 19 * 5^4 \bmod 19 * 5^{16} \bmod 19 * 5^{32} \bmod 19 * 5^{64} \bmod 19) \bmod 19$$

$$5^{117} \bmod 19 = (5 * 17 * 16 * 9 * 5) \bmod 19$$

$$5^{117} \bmod 19 = 61200 \bmod 19 = 1$$

$$5^{117} \bmod 19 = 1$$

Notes:

More optimization techniques exist, but are outside the scope of this article. It should be noted that when we perform modular exponentiation in cryptography, it is not unusual to use exponents for $B > 1000$ bits.

Answer this question...

what if the exponent has four digits

4 Votes ▲ ▼ • [Comment](#) • [Flag](#)

2 years ago by  Ismael Siddiqui

Modular exponentiation works for any exponent, even ones with 4 digits. Does this answer your question? If not, please be more specific.

EDIT: OK, I understand now. You just need an example. The process is the same, though.

OK, we need to figure out $3^{1993} \pmod{17}$.

1993-->Binary

The biggest power of 2 less than or equal to 1993 is 1024.

1993-1024

969

The biggest power of 2 less than or equal to 969 is 512.

969-512

457

The biggest power of 2 less than or equal to 457 is 256.

457-256

201

The biggest power... [\(more\)](#)

Answer this question...

I'm using a different method to calculate $7^{256} \bmod 13$ by dividing it into 7^3 and 7^{253} then continuously dividing the 7^3 into 7^{253} . I got the last iteration to be 7^4 which can be broken up into 7^3 and 7. And since $7^3 \bmod 13$ is congruent to 1, that just leaves me with $7 \bmod 13$. What am I doing wrong!?

Answer this question...

Could one take the $5^{117} \bmod 19 = (5^{17} \cdot 16^9 \cdot 5) \bmod 19$ and make it equal to $((5^{17} \bmod 19) \cdot (16^9 \bmod 19) \cdot 5 \bmod 19) \bmod 19$?

If I'm not mistaken Khan Academy has been using the following in the lessons without proof. The result for multiplication supports what you want to do. My attempt at proof is included here in case you're interested

multiplication: $(N_1 \cdot N_2 \cdot \dots) \bmod C = (N_1 \bmod C \cdot N_2 \bmod C \cdot \dots) \bmod C$ for any number of factors.

addition: $(N_1 + N_2 + \dots) \bmod C = (N_1 \bmod C + N_2 \bmod C + \dots) \bmod C$ for any series of numbers summed together.

Proof for multiplication:

given: $A \cdot B \bmod C = (A \bmod C \cdot B \bmod C) \bmod C$.

prove: $E \cdot F \cdot G \bmod C = (E \bmod C \cdot F \bmod C \cdot G \dots)$ [\(more\)](#)

Answer this question...

What is the remainder when 2^{1990} is divided by 1990?

1 Vote ▲ ▼ • [Comment](#) • [Flag](#)

2 years ago by  Jojo Rkmv

$2^{1990} \bmod 1990 = 1024$

If you apply the technique of fast modular exponentiation you should be able to calculate that. If you plug the numbers into this program <https://www.khanacademy.org/math/applied-math/cryptography/modarithmetic/p/fast-modular-exponentiation>

it will illustrate the steps

Here's the lessons for converting between bases:

<https://www.khanacademy.org/math/pre-algebra/applying-math-reasoning-topic/alternate-number-bases/v/number-systems-introduction>

Here is specifically for decimal to binary

(you may need to look at the videos earlier on in the lessons for converting between bases to understand it) :

<https://www.khanacademy.org/math/pre-algebra/applying-math-reasoning-topic/alternate-number-bases/v/decimal-to-binary>
